DEPLOY TO THE CLOUD

DEPLOY YOUR APP INTO DIGIAL OCEAN

USING DOCKER.IO

GETTING STARTED

Init a git repo on your project

```
$ cd kraken-app  
$ git init .
```

Add a **Procfile** to your project, so dokku knows how to start your application

```
web: node index.js
```

DEPLOY YOUR APP

Add a remote repo to our Krakenjs project

```
$ git add .  
$ git commit -m "Release the Kraken"  
$ git remote add deploy dokku@forge.nodefirm.com:<appname>
```

The appname you select, will be a subdomain of `forge.nodefirm.com` created on the fly during the deploy.

To deploy, you simple have to push into the remote repo

```
$ git push deploy master  
...  
# waterall of buildstep messages  
...
```

Now you can test your app by opening in your browser `.forge.nodefirm.com` or with curl

```
$ curl <appname>.forge.nodefirm.com
```

SUMMARY

- Deploy your application to a contained production environment
- Use the tools you already know, git, to deploy
